

Amendments to the Abstract

Please add the following Abstract to this application.

-- A television signal receiver (20)-having an emergency alert function is capable of checking a distance between a reference point and a point associated with a geographical area selected by a user during a setup process for the emergency alert function. According to an exemplary embodiment, the television signal receiver (20)-includes a memory (27)-operative to store data associated with the emergency alert function. A processor (27)-is operative to receive an input representing a geographical area, and to enable a predetermined output responsive to the input using the data in the memory (27)-when a distance between a reference point and a point associated with the geographical area exceeds a predetermined distance.--
